

ii. What are the different steps in grouping fields and combining tables in tableau ?

Grouping Fields -we can create a group to combine related members in a field. For example, if we are working with a view that shows average test scores by major, we might want to group certain majors together to create major categories. English and History might be combined into a group called Liberal Arts Majors, while Biology and Physics might be grouped as Science Majors.

Groups are useful for both correcting data errors (e.g., combining CA, Calif., and California into one data point) as well as answering "what if" type questions (e.g., "What if we combined the East and West regions?).

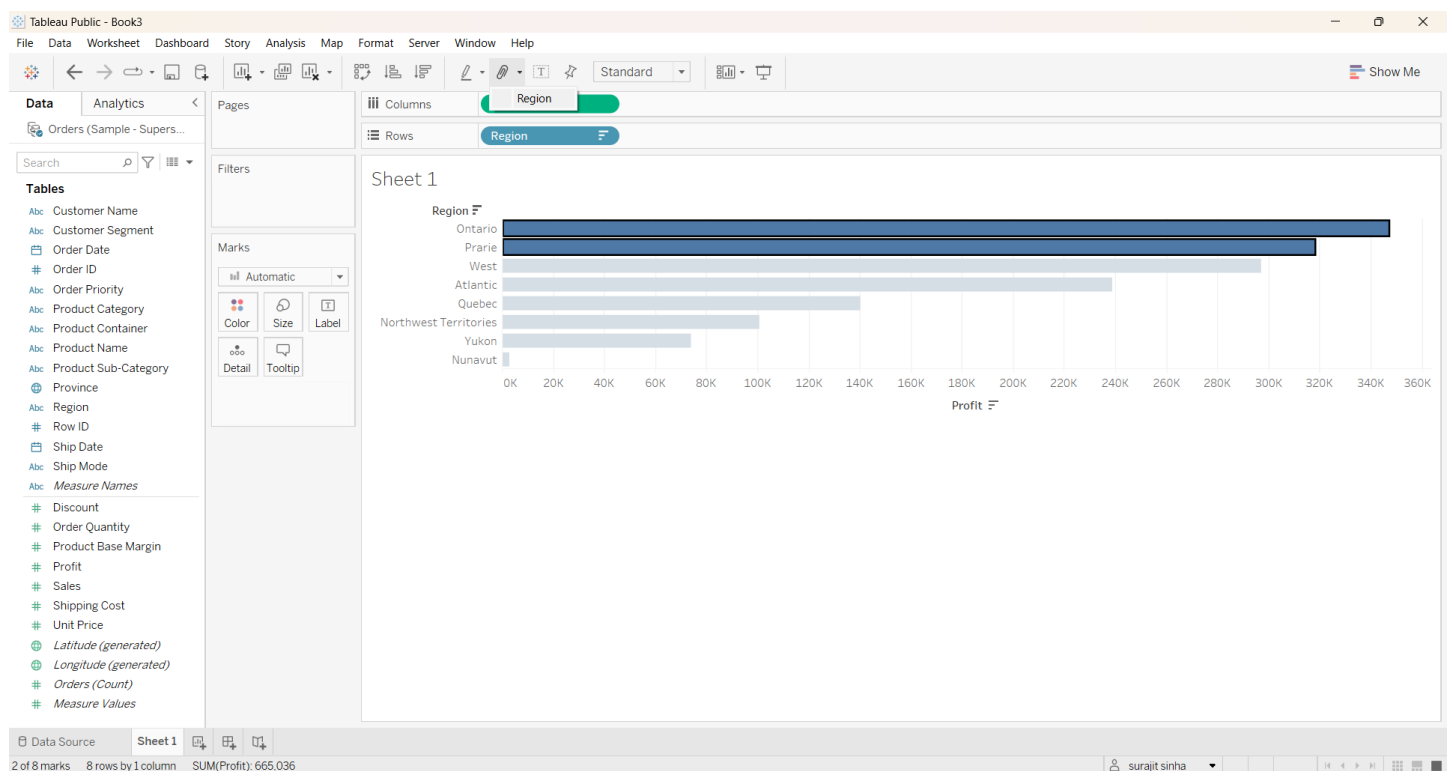

we can create a group from a field in the Data pane, or by selecting data in the view and then clicking the group icon.

Step 1- connect to a data source.

Step 2- In the view, select one or more data points and then, on the tooltip that appears, click the group icon .

Note: You can also select the group icon on the toolbar at the top of the workspace.

If there are multiple levels of detail in the view, you must select a level to group the members. You can select to group all dimensions, or just one.

Or

Step 2- In the Data pane, right-click a field and select Create > Group.
